

Habesha TTS — Streamer Partnership Proposal

1. Vision, Audience & Strategic Value

1.1 Purpose & Vision

Habesha TTS is a monetization and engagement layer built specifically for Amharic-speaking streamers. Our service transforms audience donations into expressive, queue-optimized text-to-speech audio in real time, allowing creators to maintain performance momentum without managing the operational complexity behind it.

By partnering with Habesha TTS, streamers gain a **fully managed donation-to-audio system**, supported by moderation, payment orchestration, fraud monitoring, and live operational assistance.

- **Revenue Share Model:**

Streamers retain **60%** of all processed paid donations and TTS audio activations. Habesha TTS retains **40%** to support ongoing platform hosting, real-time content moderation, compliance verification (KYB), operational services, fraud risk analysis, and dedicated concierge support.

All fees are automatically calculated and transparently displayed in the partner dashboard.

- **Why Now:**

As Ethiopian streaming communities enter a growth phase, creators require tools that feel culturally relevant, ensure **rapid payout cycles**, automate audio queues under high traffic, and support multi-platform live environments including **Twitch, YouTube, TikTok, and Telegram livestreams**. Habesha TTS is designed to fill this ecosystem gap while enabling creators to scale sustainably.

1.2 Target Audience

Habesha TTS is optimized for:

- **Individual Streamers:** Amharic or multilingual creators averaging **50+ concurrent live viewers**, seeking automatic, non-intrusive monetization through TTS overlays.
- **Live Community Hosts:** Creators managing **gaming tournaments, educational streams, charity fundraising, or community broadcasting**, requiring queue prioritization under peak donation volumes.
- **Agencies & Multi-Creator Managers:** Organizations managing **Ethiopian or diaspora talent portfolios**, looking for centralized payout tracking, automated receipts, and compliance-aligned donation infrastructure.

1.3 Core Value Proposition

1. **Instant Donation Playback & Visibility**

Donations and TTS activations populate **instantly in the live dashboard**, triggering a streamer-selected notification sound and entering a **priority-based audio queue**, ensuring minimal delay between audience engagement and audio playback.

2. **Trust & Safety Infrastructure**

The platform includes **anti-fraud scoring, automated profanity filtering, and admin**

escalation tools to maintain stream integrity, protect creators from harmful content, and keep broadcasts **audience-appropriate and family-friendly**.

3. Localized Engagement Experience

A full **Amharic-first UI/UX**, support for local and regional currencies, and **SSML-enabled Amharic TTS voice models** create a natural and community-native donation experience, increasing engagement and completion rates.

4. Effortless, Zero-Code Onboarding

Streamers activate the service without development effort using **@HabeshaTTS_bot**, receiving automated receipts for donations and having full ledger transparency via history and withdrawal logs.

2. Partnership Program — Economics & Service Structure

2.1 Official Onboarding Process

To ensure secure and compliant activation, streamers move through the following steps:

1. Bot Registration & Access Issuance

The streamer shares their Telegram handle and receives a **secure UUID onboarding link**, along with a structured checklist for fast activation.

2. Identity & KYB-Lite Compliance Verification

Partners complete a **lightweight Know-Your-Business (KYB) check**, submitting either a government-issued ID or business license, paired with payout destination verification for account security.

3. Dashboard Setup & Guided Activation

A Habesha TTS onboarding session is provided to configure essential controls, including **donation permissions, queue behavior, skip privileges, system alerts, audio replay queues, and notification sound selection**.

4. Go-Live Moderation & Technical Rehearsal

Each partner receives a **30-minute live rehearsal session** before activation, calibrating audio levels, testing TTS overlays, rehearsing moderation triggers, and validating stable audio queue playback.

2.2 Experience Features for Streamers

Partners gain access to:

- **Real-Time Dashboard** with:

Live donation timeline, TTS queue list, donation history archives, withdrawal tracking, admin chat access, and payout transparency display.

- **Queue-Based Web Audio Playback System** with:

Manual skip options for streamers, **wake-lock audio persistence** to prevent interruptions, and **connection health monitoring** that auto-flags performance issues.

- **Escalation & Support Controls** including:
One-click requests for admin review, content complaints, withdrawal assistance, or compliance clarification.

2.3 Compliance & Payment Monitoring System

To protect both the streamer and platform infrastructure, Habesha TTS applies:

- **Annual KYB-Lite Renewal**
Streamers refresh identity verification once every year using document + selfie validation.
 - **Automated Behavioral Alerts**
Real-time monitoring for **rapid donation bursts, repeated chargebacks, suspicious duplicate transactions, explicit text submissions, and account anomalies.**
 - **Daily Payment Reconciliation**
Donations processed via payment partners are balanced against the **Postgres ledger and payment processor reports**, with all manual overrides logged for audit integrity and stored transparently in the dashboard.
-

Payout Timeline & Transparency

- Withdrawal requests become available in the dashboard immediately after identity verification.
- Payout destinations are verified before first withdrawal to ensure long-term security.
- All transactions and revenue share breakdowns (60/40) are automatically recorded and visible to streamers before confirming withdrawal actions.
